Project: The World in Scale

Based on the lecture, your own research and your data collection, illustrate and organize the world from the smallest to the largest occurrences.

Look at the ways the information is transferred, various types of data and the tools developed for measurement and gathering data, as well as appliances. Think about types of energy and how they play the role in our surroundings.

Look at the visible spectrum, and how much of the information is visible to humans.

Develop icons, symbols, or images that are representative for their scale. Describe the world visually by using diagrams, numerical information, colors, and symbolic images.
