

PHYSICAL COMPUTING and INTERACTIVE/SMART PRODUCT DESIGN

COURSE: DD 364 – Digital Design Studio II (5 credits) and DD 320 – Computational Design (3 credits)
PROGRAM: Digital Design/School of Art + Design
LOCATION: second semester junior year/spring term studio; junior or senior year/spring term design elective
INSTRUCTOR: Taro Narahara

DESCRIPTION: There are two different ways to study and incorporate physical computing into a student’s design education in the School of Art + Design at NJIT. All Digital Design students take one semester of physical computing within the undergraduate design studio sequence, devoting the term to the study and use of Arduino and Processing and the creation of projects emphasizing interactive techniques. They utilize sensors in student-built projects, along with 3D printing and laser-cutting. But students in other programs including Architecture, Interior Design, and Industrial Design – as well as students from the Colleges of Engineering and Computing Sciences seek out design courses in which they can creatively “make thinking things” and study physical computing, robotics, product design with sensors, adaptive structures, and so on. These students are afforded a lab-based seminar that deals with similar issues addressed in the studio, but at a more limited scale, for only three credits, and can be targeted towards the creation of products more closely aligned with the different areas and disciplines of study represented in the diverse student body. In both the design studio and course, there is an explicit requirement to create interactive products and applications.

PROJECT: Individual interactive assignments. Some projects involve the use of Microsoft Kinect to create interactive installations (e.g. a translucent backlit screen that is (1) scalable and (2) creates patterns through interactivity with a user that is capable of becoming an interactive installation in large public spaces like hotel lobbies) and various ways particles and/or objects may be remotely manipulated through physical activity (e.g. proximity controlled lighting). Other projects require the design and construction of algorithmically-based tools to work/interact with a user (e.g. a game combined with a heart rate monitor and specific scenarios used to train cardiac patients to control heart rate in stressful situations).

REQUIREMENTS: Deliverables vary by project. In all cases, built proof-of-concept elements are required that demonstrate degree of response to stimuli. Students build all components of physical projects and work with instructor to write code in Processing.

OBJECTIVES: (1) Provide design students with an opportunity to learn some computer programming and apply the knowledge to a project that deals either with human/computer interface. (2) Require digital design students to get out of the virtual environment into the physical one by building components and thinking of user interface(s). (3) Provide an introduction to rapid prototyping, CAD/CAM, and algorithmic design for designers. (4) Explore potential relationships between various human senses (touch, hearing) and inanimate objects. (5) Provide opportunities for Industrial Design and Information Technology students to create algorithmically driven, sensor-based smart products outside of the studio sequence.
